

MINI PROJECT REPORT

Deploy a Static Portfolio Website on AWS

AWS Service	Amazon S3
Bucket	skillnexus-portfolio-2026
Region	us-east-1 (N. Virginia)
Hosting	S3 Static Website Hosting
CloudFront	Skipped for this implementation

Project Objective

Deploy the existing HTML/CSS/JavaScript personal portfolio website on AWS using Amazon S3 Static Website Hosting and make it publicly accessible through the generated S3 website endpoint.

Implementation with Screenshots

Step 1 — Create the S3 Bucket

Created the Amazon S3 bucket **skillnexus-portfolio-2026** in the AWS us-east-1 region. The bucket is used as the storage location for the portfolio website.

Figure 1: Evidence for Create the S3 Bucket.

Step 2 — Enable Static Website Hosting

Enabled **S3 Static Website Hosting** for the bucket and configured it for bucket website hosting. AWS generated the region-specific website endpoint.

Figure 2: Evidence for Enable Static Website Hosting.

Step 3 — Upload the Portfolio Files

Uploaded the existing portfolio website files: **index.html**, **styles.css**, **script.js**, and the required images inside the **assets/** folder.

Figure 3: Evidence for Upload the Portfolio Files.

Step 4 — Verify File Upload

AWS confirmed that all **7 files** were uploaded successfully to the S3 bucket, including the website files and assets.

Figure 4: Evidence for Verify File Upload.

Step 5 — Configure Public Access

Turned off **Block all public access** for this bucket so that the static website can be accessed publicly.

Figure 5: Evidence for Configure Public Access.

Step 6 — Add the Bucket Policy

Added a bucket policy granting public **s3:GetObject** access to objects in the portfolio bucket. AWS confirmed the bucket policy was successfully edited.

Figure 6: Evidence for Add the Bucket Policy.

Step 7 — Test the Deployed Website

Opened the S3 static website endpoint in a browser and verified that the complete portfolio website loads successfully.

Figure 7: Evidence for Test the Deployed Website.

Project Outcome

The portfolio was successfully deployed on Amazon S3 and verified through the S3 static website endpoint. The implementation demonstrates object storage, static website hosting, file upload, public access configuration, and bucket-policy based access control.

Learning Outcome

This project provided practical experience with AWS S3, static website hosting, bucket permissions, website endpoints, and deploying a real HTML/CSS/JavaScript project to the cloud.

Note: CloudFront CDN was intentionally skipped for this version of the mini project.
